INTRODUCTION

Under the comparative study of skills and market rates for a set of hospitals selected by Coomeva Prepaid Medicine and the Ministry of Health, Welfare and Sports of the Kingdom of the Netherlands, this document contains the report with the results obtained from information reported by the institutions contacted.

To develop the study, 36 institutions were analyzed; only 14 institutions finally submitted their data. The report is presented in three sections, the first is the technical development of the consultancy, the second presentation of results and their scope in terms of benchmarking and the third the conclusions and recommendations.

SIGIL'S team is grateful to the participating institutions in the processes of planning, surveying and validation of the information.

The opinions and content of the report are the sole responsibility of the consulting firm, and therefore neither compromise nor is the responsibility of Coomeva Prepaid Medicine and the Ministry of Health Welfare and Sports of the Kingdom of the Netherlands.

1. METHODOLOGY USED FOR THE DEVELOPMENT OF THE CONSULTANCY

This chapter presents the methodology applied in the processes of collection, processing and analysis of the information gathered from the selected institutions. The methodology applied is consistent with the proposal submitted to Coomeva Prepaid Medicine and the Ministry of Health, Welfare and Sports of the Kingdom of the Netherlands at the beginning of the project.

1.1. Scope of the Study

Considering that the scope of the study is to generate information to learn the market offer, capacities and rates offered by a group of institutions to provide health services to the population of the territories of Bonaire, Saint Eustatius and Saba, which are Special Municipalities the Netherlands in the Caribbean¹. These territories have around 18,000 inhabitants of which 92% reside in Bonaire, from the point of view of the demand for health services this population size was considered by several of the institutions interviewed as small, uninteresting without growth possibilities.

The technical development of the consultancy moved forward aiming in the collection and processing of information regarding the offer and the rates of a group of selected medical procedures, to conduct a comparative analysis of services.

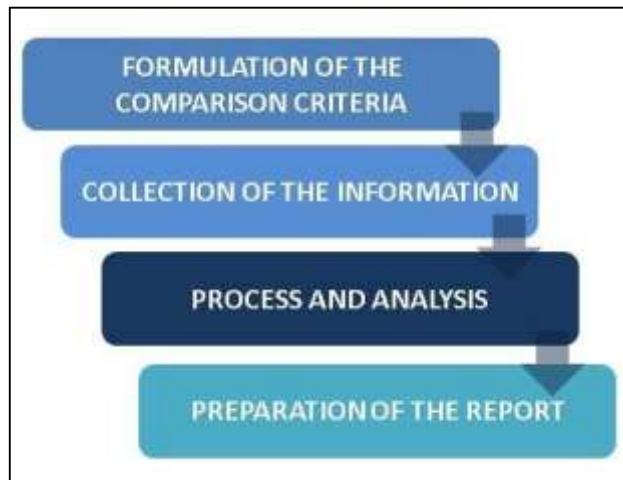

It is expected that the results of this study will serve as a guiding framework for assessing the supply and availability of health care services in the international market in the region and to formulate strategies for procurement by the Ministry of Health, Welfare and Sports of the Netherlands and as well to learn lessons on conditioning factors in these studies.

1.2. Stages

The applied methodology was based on the development of the stages that are shown in *Figure 1. Stages of the Study*

¹ Also referred to as public entities (Openbare Lichamen)

Figure 1. Stages of the Study

Source: Sigil Consulting Group 2014

Stage 1. Formulation of the comparison criteria

This step was the formulation of the comparison criteria between the participant institutions and it was oriented aiming the capture the information about capabilities and conditions for providing quality health care services of international patients. Given this, it was necessary to define concepts and criteria that address the reasons for evaluation, because usually the concepts or quality measurements are immersed in the institutional settings and are not necessarily applicable internationally.

At this stage we sought to collect basic information that allow the assessment of the quality and allow us to determine if all the institutions analyzed meet with a minimum criteria for the provision of the necessary services, therefore in the developed instrument indicators that show the level of the capacity that an institution have to provide specialized services in international health were included.

This stage included the following steps:

- a) Definition of the evaluation model
- b) Development of the appraisalment criteria
- c) Implementation of pilot testing and adjustments

a. Definition of the evaluation model

In order to build the evaluation model, we adapted the basic theory of an evaluation process, the definitions of the indicators and the methodology for the creation of a Benchmarking.

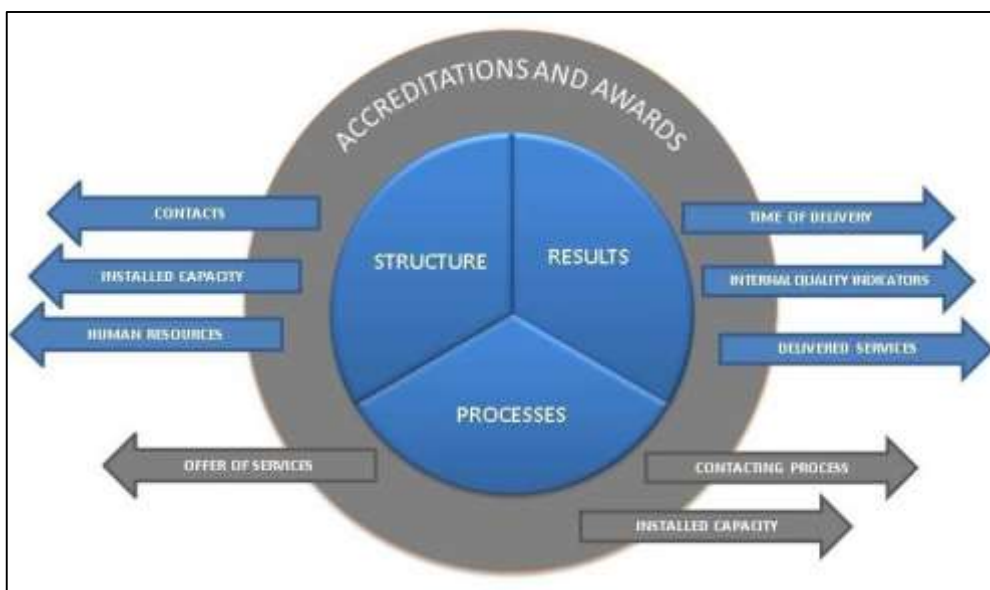

Based on the theory of systems that is based on the identification of the structure of processes and results, and the application of the methodology of "mystery shopper" for the creation of a Benchmarking where individuals act like independent observation units to be compared in a final stage, but where the individual characteristics and individualities contribute to the final outcome of the study.

Based on the above, an "Offer Appraisal Model" (MVO) was structured to integrate elements of installed capacity, service delivery, quality and management of the institutions.

The model is aimed at measuring the capacity to serve international patients, the ability to provide security for patients, the response process and to generate information from a network of selected institutions under the study. See **Figure 2**.

The MVO links, both the process of achieving information and the aspects of capacity, offer, service quality and rates.

Figure 2. Offer Appraisal Model (MVO)

Source: Sigil Consulting Group 2014

b. Construction of the criteria

Given the MVO and criteria to evaluate, an instrument was built to facilitate the collection of information and its comparability. (**Figure 3**), we presented the prototypes of the protocols in Spanish, English and French that were used in the collection of information. As indicated in Annex 1, this instrument included the

specification of a set of related physical and technical capacity criteria, human resources, clinical outcomes and rates.

Figure 3. Presenting the Instrument for Information collection

Source: Sigil Consulting Group 2014

c. Validation and adjustment of the Instrument

The data collection instrument was validated and adjusted based on the results of its application in the Santa Fe de Bogota Foundation.

Finally, the Analysis of the defined dimensions encompassed six aspects as indicated in **Figure 4. Dimension of the analysis of quality of the institution**

Additionally we foresee the need to incorporate some variables that measured the ability of commercial response and management of the institutions analyzed.

Figure 4. Dimension of the analysis of quality of the institution

Source: Sigil Consulting Group 2014

The first dimension analyzes the offer of services of each institution in relation to general services and specialist services and the offer of international health services.

The second dimension presents installed capacity in each institution in relation to infrastructure and equipment, concepts grouped into physical resources required for the delivery of service.

The dimension of human resources analyzes the amount of health professionals by type of specialty.

The next dimension presents the amount of services provided by each institution in the different specialties.

The dimension of indicators presents the results concerning five indicators that allow measuring the internal quality of the institutions and also measures the quality of services and patient safety. The indicators were:

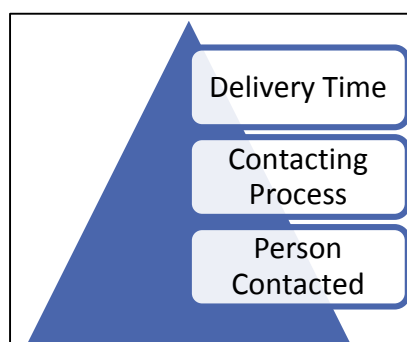

- Number of procedures performed in the last 12 months.
- Percentage of compliance in surgical scheduling.
- Occupancy rate.
- Rate of nosocomial infections.
- Percentage of adverse events
- Rate of satisfaction

The last dimension analyzes certifications and accreditations that each institution has, both national and internationally, such as:

- Accreditations and awards won by institution.
- Certifications such as Joint Commission International and others.
- Awards for quality such as Malcom Baldrige and others.
- European Foundation for Quality Management (EFQM).
- Certifications such as ISO 9001 or others.

In **Figure 5** we presented the criteria defined for analyzing the dimension to measure the capacity for commercial response. In general, we considered i) The time between receiving training and send the information, ii) the process of contacting encloses the relevant characteristics for the execution of the process with the channels of communication and the communication management and iii) the ability to respond and management skills of the person (s) contacted, their characteristics and level of power in the decision-making.

Figure 5. Dimensions of the commercial response

Source: Sigil Consulting Group 2014

With regard to the comparative analysis of rates, the selected procedures are indicated in Table 1. **List of selected treatments and procedures**, in each of the institutions the breakdown of these costs for medical fees, medicines, supplies, materials and OR rights. Unfortunately, most institutions did not provide the information either because they did not have it or because the costing system of services is based on the cost per event according to resource consumption and therefore the rate is variable. Generally, it is observed that the institutions made no further effort to deliver or detailed information about rates.

Table 1. List of selected treatments and procedures

No	Type	Procedure
1	Orthopedic	UNILATERAL KNEE REPLACEMENT
2	Orthopedic	UNILATERAL HIP REPLACEMENT
3	Orthopedic	UNILATERAL ARTHROSCOPY KNEE
4	Orthopedic	UNILATERAL ARTHROSCOPY SHOULDER
5	Orthopedic	ORTHOPEDIC CONSULTATION COST

Stage 2. Collection of the information

In this stage, the institutions were selected to participate, the study had as a logical result that some of the institutions were chosen for patient care, this implied filling the form or instrument for collecting information and handed to one of our senior consultant who, then reviewed the information and complemented it with relevant qualitative information.

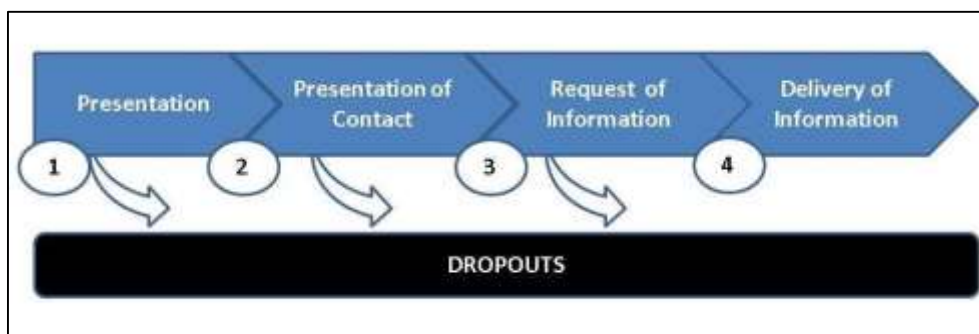

According to the agreement with Coomeva prepaid medicine and the Ministry of Health, Welfare and Sports of the Netherlands, the firm agreed to handle the information in strict confidentiality and solely for purposes of decision-making by the Ministry. The firm signed confidentiality agreements with each institution that participated in the study.

For gathering the information the following steps were performed inside each organization:

- a. Identify the institutions.
- b. Presentation and approval by Coomeva prepaid medicine.
- c. Identify key contacts in each institution.
- d. Organize teleconferences to explain the advancing and goals of the study.
- e. Visits and interviews with each institution.
- f. Collection and review the consistency of the information.
- g. Request for clarification and/or supplementation of missing data.

The contact process was managed using an approach method and commercial contacting, in which the institutions responded to achieve the procurement and delivery of the information, as indicated in **Figure 6. Process of Commercial Contact**

Figure 6. Process of Commercial Contact

Source: Sigil

Consulting Group 2014

A balance of the results in the contacting stage indicated that 77% of those contacted decided not to participate from the beginning, 9% once the contact was assigned this decided not to participate and 14% decided not to participate at the time of delivering the information. Detailed information on dropouts by institution is presented in A balance of results in the contact of the institutions indicated that 77% chose not to participate from the beginning, 9% once the contact is decided not to participate and 14% decided not to participate at the time of delivery was assigned information detailed information on dropouts in the process of trade contacts per institution is presented in **Table 2**.

It is very important to highlight that for each process of monitoring and controlling of the contacting process, SIGIL CONSULTING GROUP kept a detailed record of the phone calls, communications and contacts in each one of the institutions. In previous reports presented to Coomeva prepaid medicine and the Ministry of Health, Welfare and Sports of the Netherlands you can find this information.

In this regard, the institutions were monitored by a measuring table of approach and follow up, in which each consultant managed the information, the pending and the number of approaches necessary to advance into the next stage was documented. With this, we were able to identify in advance when to start looking for the replacements.

Table 2. Relation of institutions that abandoned the process

Complementing this, with Coomeva prepaid medicine and the Ministry of Health, Welfare and Sports of the Netherlands coordination a process of searching started to find new institutions to compensate those that decided not to continue with the study. This process was performed under two modalities:

- Secondary Search: Identification in each country of those institutions that have the potential to offer international health services. For example, in Barbados we found a tendency for public institutions that were not interested in international patients.
- Search through organizations. We approach hospitals through hospital organizations to identify and contact the institutions with the size and structure and after verification thru their websites and a visit to the facilities (this methodology was used primordially in the Dominican Republic and Panama).

As result, in **Table 3** we present a summary of the contacted institutions. Out of the 23 institutions that were included in the contract, SIGIL contacted 13 additional institutions and 14 delivered the information.

Table 3. Relation of analyzed institutions

Country	Contact	Additional Search	Positive Answer	With Information
Colombia	5		5	5
Panama	2	4	0	0

Total	23	13	17	14

Source: Progress reports submitted to COOMEVA MEDICINA PREPAGADA S.A.

For collecting the information, a team of 8 consultants had the responsibility for contacting and gathering the information on each of the institutions. The institutions that fully delivery the information were:

Institution 1: Hospital Pablo Tobón Uribe, Colombia

Institution 2: Clínica CardioVid, Colombia

Institution 3: Clínica Las Américas, Colombia

Institution 4: Fundación Santa Fe de Bogotá, Colombia

Institution 5: Fundación Cardio Infantil, Colombia

Institution 6: Clínica CIMA, Costa Rica

Institution 7: Clínica Bíblica, Costa Rica

Institution 8: Plaza General de la Salud, Dominican Republic

Institution 9: Hospital Metropolitano de Santiago, Dominican Republic

Institution 10: HIMA Health, Puerto Rico

Institution 11: PRESBY, Puerto Rico

Institution 12: Hospital Dr. Horacio Oduber, Aruba

Institution 13: Saint Elisabeth Hospital, Curacao

Institution 14: Centro Hospitalario de Guadalupe, .Guadalupe

Stage 3. Process and Analysis

For the standardization of information, the information reported in the formats provided by SIGIL Consulting was used, however in the processing of the information some of the institutions did not provide the information as requested and presented the information available, in some cases incomplete and/or not comparable. In the next section, the main problems associated with the comparability of data are presented in detail.

The first step taken was to debugging the information and the request for clarification of the data with some institutions. In some cases no response was received.

A process of organizing folders, standardizing the data collection instrument, was made by reviewing the information provided and generating a folder of attachments for additional information.

A matrix with the standardized information was built with the various analyzed dimensions and another matrix with the information concerning rates (Annex 3).

For the analysis, specific indicators were defined. The indicators are described as follows:

Indicator 1: Index of the Offer of International services: It is calculated by validating the achievement of the following criteria:

- Experience in the care of international patients.
- Effective International accreditations or the commitment to start the process in the next 2 years.
- Internationalization of services as part of the strategic development plan of the institution.
- Implemented department or in the process of implementing an international patient care department.

Then a value of 1 is given for each of the criteria that is accomplished, otherwise a value of zero is given. Then it is divided by 4, which are the total parameters evaluated.

Indicator 2: Average index of the installed capacity: With this index the following basic services:

- Cardiology
- Gynecology – Obstetrics
- Neurosurgery
- Ophthalmology
- Oncology
- Orthopedics
- PET CT test

A value of 1 was given for each of these services; otherwise, a value of zero was assigned. The total is then divided by 7.

Indicator 3: Index of Diagnostic services capacity. The parameters evaluated were:

- Conventional Radiology
- Portable x-ray services
- Intraoperative Imaging (C arm)
- CT scan
- MRI
- Doppler
- 3D Ultrasound
- 4D Ultrasound
- Mammography
- Catheterization Laboratory

- Angiography Laboratory
- Densitometry
- Cystoscopy
- Laparoscopy
- PET / CT

For those insititutions that offer these services a value of 1 was given, otherwise, a value of zero was assigned. The resulting number is then divided by 15.

Indicator 4: Medical Specialization Index: to calculate this index (MSI), the specialties covered by the specialists were analyzed and a value of (1) was given to each one that is offered. If the specialty is not covered, then a value of zero was given. The resulting figure is then divided by 7. The specialties evaluated were:

- Cardiovascular surgery
- Gynecology and Obstetrics
- Ophthalmology
- Orthopedics
- PET CT
- Neurosurgery
- Oncology

Indicator 5: Index of accreditations and awards: To calculate this index, the accomplishment of the variables was reviewed and certified, for those that fulfilled the requisites a value of 1 was given, if not a value of zero was given. The resulting figure was then divided by 7. The parameters evaluated were:

- Amount of international certifications (I1)
- Certifications such as Joint Commission International Accreditation (I2)
- Received awards for quality such as Malcolm Baldrige and others (I3)
- European Foundation Quality Management (EFQM) (I4)
- Certifications such as ISO 9001 and others (I5)
- International recognitions (I6)
- Association with universities (I7)

Additionally, a series of validations were developed on those clinics that delivered the information on the commercial process and the contact person, with relation of those aspects previously described:

- In the delivery time dimension and contacting process: the following indicators were determined: scaling, access, management and agility.

- In the dimension of the contact person, the indicators evaluated were empowerment in the decision making process, comparability, interest in the commercial process, interest in the case study.

This information was compiled based on the judgment and perception of the consultants, under a created matrix of the commercial process. Annex 3.

Stage 4. Preparation of the report

Based on the compiled information, SIGIL CONSULTING prepared for Coomeva prepaid medicine and the Ministry of Health, Welfare and Sports of the Netherlands a document that summed up the findings with relation of the benchmarking of international rates of a sample of medical procedures selected by COOMEVA.

2. COMPARATIVE RESULTS

In this chapter we present the findings and results for the different variables and indicators analyzed in relation with the commercial process and the offer of the selected health services.

2.1. Evaluation of the commercial process

A first aspect to analyze is the result in the business approach. Out of 36 contacted institutions, only 14 accepted to participate. This was possible due to the systematic process of following up, through the organization of several visits to some of the institutions and for the searching of substitute institutions after identifying problems with participation by some of them. The consolidated results are presented in **Table 4**. (See Annex 2)

Table 4. Commercial Process Index by Institution

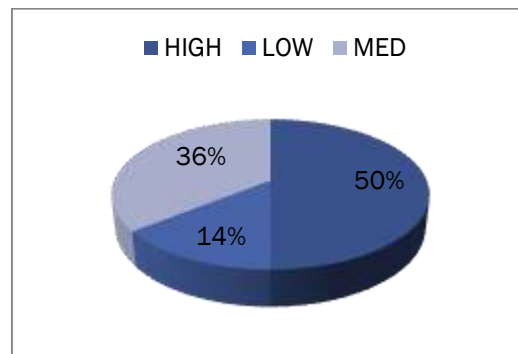

CLINIC/HOSPITAL	COMMERCIAL PROCESS			HUMAN RESOURCES				
	Access	Scale	Management	Empowerment	Assertiveness	Agility	Interest in the Commercial Process	Interest in the Case Study
Hospital Pablo Tobon Uribe Colombia	High	Quick	Good	YES	High	#	High	Med

--------------------------------------------	-----	------	---------	-----	------	---	-----	-----

Source: Sigil Consulting Group. Consolidated matrix of results.

As a result of the commercial process in the 14 institutions, we gained access and various communication channels were opened, like email and by telephone, altogether supported by one or two physical visits. However, the communication was not so fluid, because the persons we to contact do not respond or cancelled appointments making the consultants to invest too much time making appointments and resending communications, besides the fact that the site visits had to be reschedule.

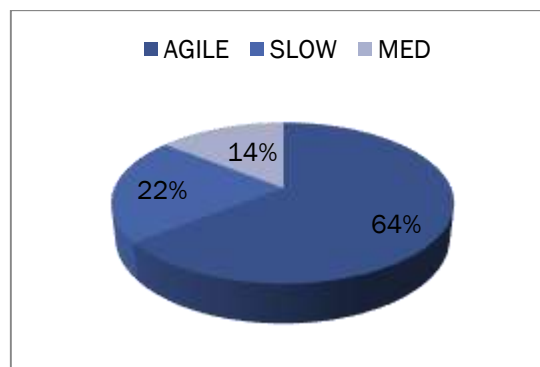

Figure 7. Results of the access indicator

Source: Sigil Consulting Group. Consolidated matrix of results.

With relation to contacting people with scaling, although it implied time it was a rather quick process in the 64% of the institutions, due to the fact that the profile of the consultants and the presentation of the case study allowed having access to directors who delegate the collection of information to others.

Figure 8. Results of the scaling indicator

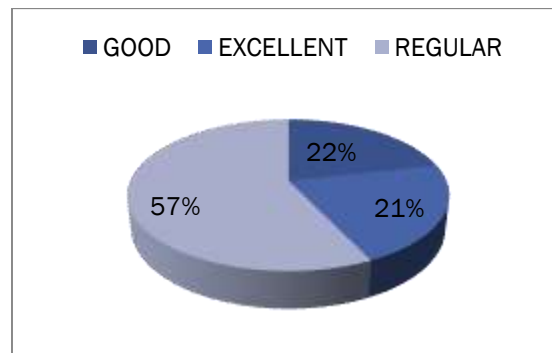

Source: Sigil Consulting Group. Consolidated matrix of results.

With relation to the management capacity, it is observed that in the 76% of the institutions the consultants identified problems and/or deficiencies in the commercial management. Although the analyzed institutions are highly specialized and of a very

high scientific and administrative level, they presented flaws in the administrative level. These are operations oriented to the development of health services but with a low level in the commercial management and with the communications with potential clients. As a result, they do not pay enough attention to a potential customer, in this particular case, many of them expressed low interest because of the market size or because of the lack of clarity in the rules of contracting.

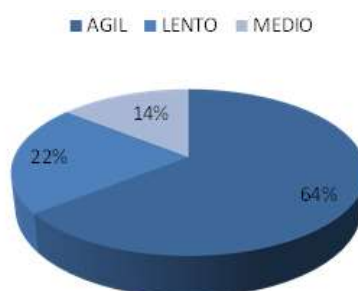

Figure 9. Results management indicator

Source: Sigil Consulting Group. Consolidated matrix of results.

As the degree of power indicator in the decision making process is analyzed, in 79% of the institutions was evident the degree of power in the decision making process in the person assigned to the project, due in great part of the position they had inside the institutions, however, this was also a problem because they didn't have the enough time, nor the a high priority was given to the development of the project. These persons also indicated that their institutions were not minded in giving an additional effort for collecting the information.

Figure 10. Decision making results indicator

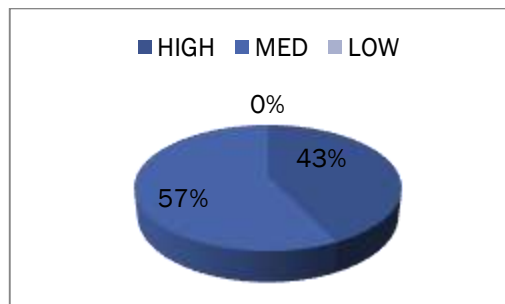

Source: Sigil Consulting Group. Consolidated matrix of results.

The comparison criteria tried to measure the degree of similarity of the information collected in each institution and how this information can be compared to one

another. The results indicated that 43% of the institutions had fairly comparable information. Although the information delivered was credible, it was provided according their own process of information, to adapt it to the format of the instrument was in some institutions impossible to achieve, so therefore homogeneity and comparability problems were generated.

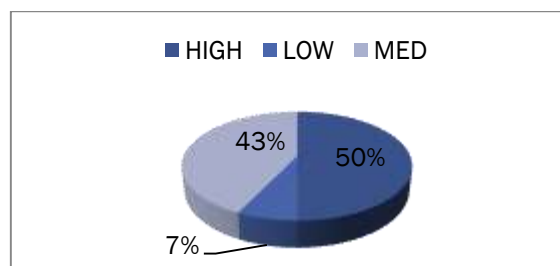

Figure 11. Results for comparability indicator

Source: Sigil Consulting Group. Consolidated matrix of results.

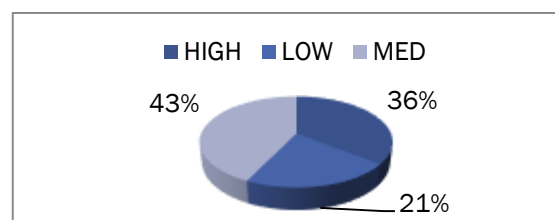

As general conclusion for the general interest in the process of commercial approach and in the interest in participate in the study, the figures indicate that there was very little interest to participate in a new Project of international health and particularly to participate in the study, because many institutions requested more detailed information about the demand of services, the contracting conditions and the payment Schedule.

Figure 12. Results for the commercial process indicator

Source: Sigil Consulting Group. Consolidated matrix of results.

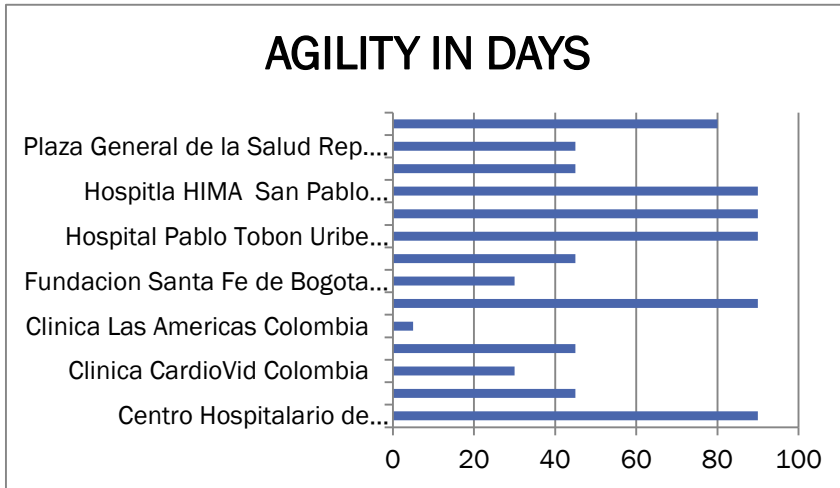

Figure 13. Results of the interest in participate in the study indicator

Source: Sigil Consulting Group. Consolidated matrix of results.

The response time measured from the moment the assigned contact person committed to supply the information, this is around 45 days. During the physical visit, nearly 80% of the requirements that were not supplied during the follow up process were then managed.

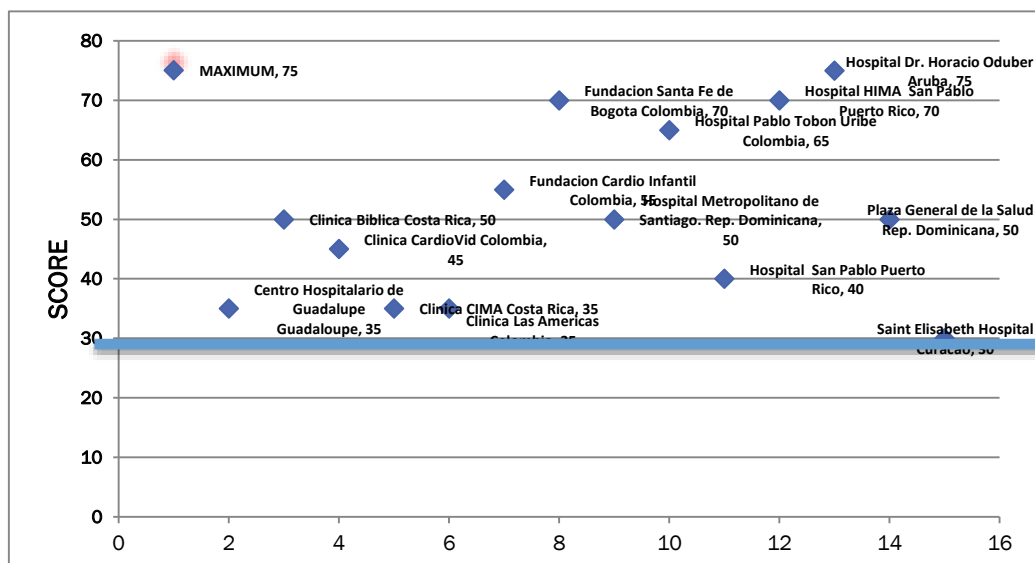

Figure 14. Average time to deliver the information

Source: Sigil Consulting Group. Consolidated matrix of results.

The comparative synthesis of the information of the commercial process indicated that three institutions are notable because of their high scores: Fundacion Santa Fe de Bogota (Colombia), Hospital HIMA San Pablo (Puerto Rico) and Hospital Horacio Oduber (Aruba).

Figure 15. Comparativeness score of approach and commercial management

Source: Sigil Consulting Group. Consolidated matrix of results.

2.2. Offer of International Health Services

To calculate indicator 1, related to the index of offer of international services and based on the reported information, 100% of the institutions reported to have international health services. In order to demonstrate their capacity to bid for these services, the following aspects were considered:

- Experience in treating international patients.
- Effective international accreditation and/or the commitment to initiate the process of accreditation in the next 2 years.
- Internationalization of the services as part of the institutional strategy development plan.
- The existence of a department or process for the implementation for treating international patients.

Using these criteria as a start point, the specialization index is calculated for these services in which the degree of accomplishment is measure for each institution. The results for the evaluation of this point indicate that 80% of the institutions meet the majority of the parameters analyzed. Additionally, 8 of the institutions meet 100% it tge established parameters, 6 meet 75% and only one with the 63%, presenting an average of 86% in the offer of international services, as indicated in **Table 5**.

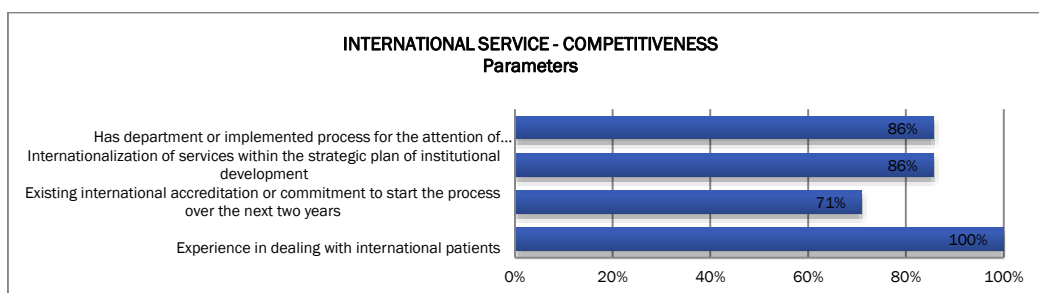

Table 5. International Offer of Services

Name of the Institution	Rating of specialization in international health
Hospital Pablo Tobón Uribe Colombia	75%
Clinic Cardio Vid Colombia	75%
Clinic Las Americas Colombia	100%
Fundación Santa Fe de Bogotá Colombia	100%
Foundation Cardio Infantil Colombia	100%
Clinic CIMA Costa Rica	75%
Clinic Biblica Costa Rica	100%
Plaza General de la Salud Rep. Dominicana	100%
Hospital Metropolitano de Santiago. Rep. Dominicana	75%
Hospital HIMA San Pablo Puerto Rico	100%
Hospital El PRESBY. Puerto Rico	100%
Hospital Dr. Horacio Oduber Aruba	63%
Saint Elisabeth Hospital. Curacao	75%
Centro Hospitalario de Guadalupe. Guadalupe	100%

Source: Sigil Consulting Group. Consolidated matrix of results.

Additionally, the entire set of institutions expressed having experience in the treatment of international patients, 71% indicated the intention of having or already have international accreditation. In general, an interest to treat this type of patient is observed.

Figure 16. International Services Offer

Fuente: Source: Sigil Consulting Group. Consolidated matrix of results.

2.3. Installed capacity and offer of services

The installed capacity in the hospitals is analyzed base on two variables, the number of Beds and the equipment and the human resources.

With relation of the amount of beds, the information reported indicated that the institutions have as an average 288 beds (excluding Hospital Metropolitano de Santiago, due to the deviation that it will present), as illustrated in **Table 6**.

Table 6. Number of Beds

Name of the Institution	Number of Beds
Hospital Pablo Tobón Uribe Colombia	371
Clínica Cardio Vid Colombia	158
Clínica Las Américas Colombia	358
Fundación Santa Fe de Bogotá Colombia	246
Fundación Cardio Infantil Colombia	330
Clínica CIMA Costa Rica	56
Clínica Bíblica Costa Rica	111
Plaza General de la Salud Rep. Dominicana	285
Hospital Metropolitano de Santiago. Rep. Dominicana	1.476
Hospital HIMA San Pablo Puerto Rico	430
Hospital El PRESBY. Puerto Rico	195
Hospital Dr. Horacio Oduber Aruba	533
Saint Elisabeth Hospital. curacao	422
Centro Hospitalario de Guadalupe. Guadalupe	244

Source: Sigil Consulting Group. Consolidated matrix of results..

The offer of services will be analyzed based on several criteria (Indicator 2 Average index of the installed capacity). The first one is the services offered by the hospital in relation to:

- Cardiovascular surgery
- Gynecology and obstetrics
- Gynecology
- Neurosurgery
- Ophthalmology
- Oncology
- Orthopedics
- PET CTE

According with the submitted information, we found that 80% of the institutions have coverage over 88% of the services studied, and just one institution is under 75% of coverage; the results are presented in **Table 7**.

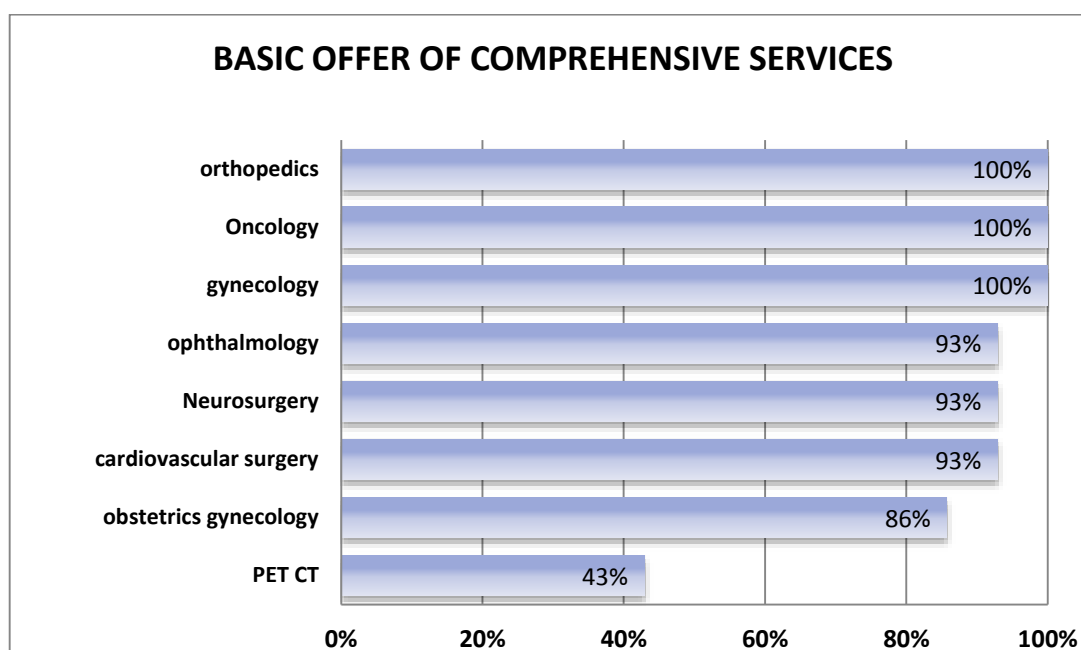

Table 7. Percentage of offered services

Name of the institution	Rating of coverage
Hospital Pablo Tobón Uribe Colombia	100%
Clínica Cardio Vid Colombia	75%
Clínica Las Américas Colombia	100%
Fundación Santa Fe de Bogotá Colombia	100%
Fundación Cardio Infantil Colombia	75%
Clínica CIMA Costa Rica	100%
Clínica Bíblica Costa Rica	88%
Plaza General de la Salud Rep. Dominicana	88%
Hospital Metropolitano de Santiago. Rep. Dominicana	88%
Hospital HIMA San Pablo Puerto Rico	100%
Hospital El PRESBY. Puerto Rico	63%
Hospital Dr. Horacio Oduber Aruba	100%
Saint Elisabeth Hospital. Curacao	75%
Centro Hospitalario de Guadalupe. Guadalupe	88%

Source: Sigil Consulting Group. Consolidated matrix of results..

The overall results showed that the basic services are generally offered, with the exception of PET CT that is only present in 43% of the institutions.

Figure 17. Percentage of institution by specialty that offer the service

Source: Sigil Consulting Group 2014

Within the offer of services, the second parameter that was evaluated was the specialized diagnostics services and for this purpose 17 services were defined and analyzed. The results are shown in **Table 8**. This information belongs to indicator 3: Capacity index for diagnostic services.

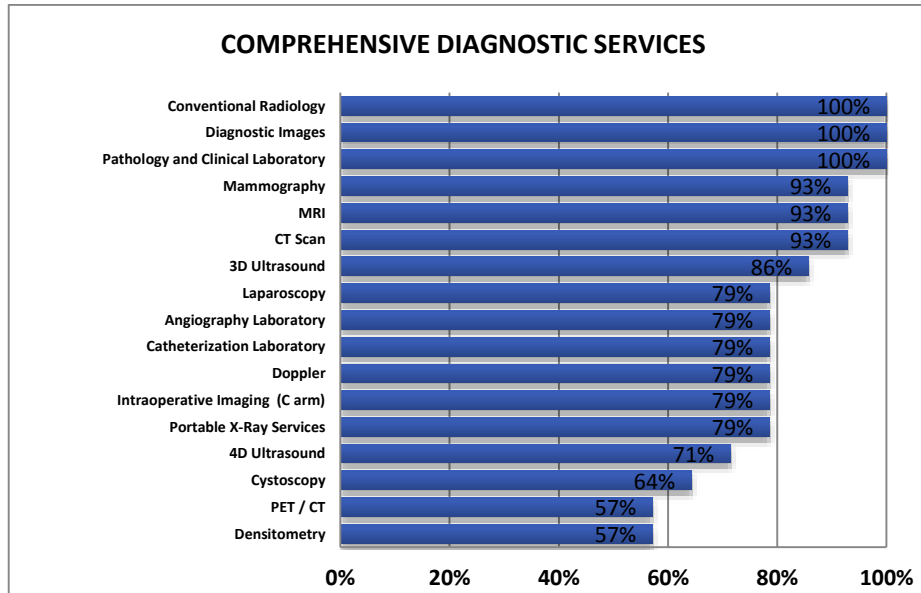

Table 8. Diagnostic support offer of services

Name of the institution	Index of Completeness
Hospital Pablo Tobón Uribe Colombia	76%
Clínica Cardio Vid Colombia	65%
Clínica Las Américas Colombia	100%
Fundación Santa Fe de Bogotá Colombia	100%
Fundación Cardio Infantil Colombia	71%
Clínica CIMA Costa Rica	100%
Clínica Bíblica Costa Rica	94%
Plaza General de la Salud Rep. Dominicana	65%
Hospital Metropolitano de Santiago. Rep. Dominicana	71%
Hospital HIMA San Pablo Puerto Rico	100%
Hospital El PRESBY. Puerto Rico	65%
Hospital Dr. Horacio Oduber Aruba	59%
Saint Elisabeth Hospital. curacao	76%
Centro Hospitalario de Guadalupe. Guadalupe	100%

Source: Sigil Consulting Group. Consolidated matrix of results.

With respect to the comprehensive diagnostic services, we presented the coverage of these services by institution. In **Figure 18**, it is observed that the diagnostic services more common in all the institutions are conventional radiology, diagnostic images, pathology and clinical laboratory, and the ones with less coverage are PET CT and densitometry with only 57%.

Figure 18. Percentage of institutions that offer the service by equipment type

Source: Sigil Consulting Group. Consolidated matrix of results.

2.4. Human Resources

According to indicator 4 the Medical Specialty Index the human resources were determined in each institution and it was analyzed in function of the following type of specialty:

- Cardiology
- Electrophysiology Cardiology
- Hemodynamic Cardiology
- Pediatric Cardiology
- Cardiovascular surgery
- Gynecology
- Ophthalmology
- Orthopedics
- PET CT (Positron Emission Tomography / computed)
- Neurosurgery
- Oncology
- Conventional Radiology

- Chest radiology

Considering these specialties, in **Table 9** the number of specialists in each institution is presented.

Table 9. Specialized Human Resources by Hospital

Name of the Institution	Number of specialists
Hospital Pablo Tobón Uribe Colombia	64
Clínica Cardio Vid Colombia	52
Clínica Las Américas Colombia	66
Fundación Santa Fe de Bogotá Colombia	82
Fundación Cardio Infantil Colombia	90
Clínica CIMA Costa Rica	102
Clínica Bíblica Costa Rica	53

Hospital Metropolitano de Santiago. Rep. Dominicana	42
Hospital HIMA San Pablo Puerto Rico	96
Hospital El PRESBY. Puerto Rico	20
Hospital Dr. Horacio Oduber. Aruba	12
Saint Elisabeth Hospital. Curazao	26
Centro Hospitalario de Guadalupe, Guadalupe	54

Source: Sigil Consulting Group. Consolidated matrix of results.

2.5. Certifications

To compare the certifications and accreditations of each hospital, we considered the following criteria:

- Amount of international recognitions
- Amount of international certifications
- Certifications such as Joint Commission International Accreditation
- European model (European Foundation for Quality Management (EFQM))
- Amount of certifications such as ISO 9 1 and others

Table 10. Certifications, accreditations and awards

Installations	International awards	Number of international certifications	Certifications such as Joint Commission International	Awards for quality like Malcom Baldrige	European quality model EFQM	Certifications like ISO 9 1 and others.
---------------	----------------------	----------------------------------------	-------------------------------------------------------	-----------------------------------------	-----------------------------	-----------------------------------------

			Accreditation	and others		
Hospital Pablo Tobón Uribe Colombia	Yes		Yes	Yes	No information	Yes

Source: Sigil Consulting Group. Consolidated matrix of results

Inside the institutions that reported this information, it is shown that there is a high interest to maintain quality standards either because of the certifications or the awards received.

2.6. Clinical results indicators

This dimension, corresponding to indicator 5, index of accreditations and awards, the results of the four indicators that allow measuring the internal quality of the institutions and measures the quality of the services and the safety of the patient. The indicators defined were:

- Percentage of accomplishment in the scheduling of surgeries: total number of procedures performed divided between the total numbers of programmed procedures multiplied by 100.

- Standardized occupancy rate: Average stay: total number of days of hospitalization in the period divided between total number of hospitalized patients in the same period.
- Nosocomial infection index: Number of nosocomial infections divided between the total number of hospitalized patients by 100.
- Percentage of adverse events: An adverse event is one that causes damage to the patient, after the patient is admitted in the institution and is related to the care provided during a base illness.
- Satisfaction index: Measure and method to evaluate the user's satisfaction.

It is important to highlight that the hospitals defined their own variables and parameters each one of the indicators, therefore they are not completely comparable. The following table presents the observed results.

Table 11. Percentage of accomplishment in surgical scheduling

Institutions	Percentage of accomplishment in surgical scheduling	Observations
Fundación Santa Fe de Bogotá Colombia	96%	
Clínica CIMA Costa Rica	96%	
Clínica Bíblica Costa Rica	100%	
Plaza General de la Salud Rep. Dominicana	84.5%	Programmed 6,367 y Accomplished 5,383
Hospital Metropolitano de Santiago. Rep. Dominicana	98%	
Hospital HIMA San Pablo Puerto Rico	96,40%

2.7. Consolidated results

The consolidated results are presented in function of the five indicators previously defined.

2.7.1. Offer of services

To obtain an adequate offer of services, the following parameters were considered for the evaluation:

- Offer of International services
- Offer of basic services
- Offer of specialized services
- Offer of Diagnostic services

The latter three framed the offer's installed capacity, an average indexed will be calculated with the purpose of observing the degree of relation between the international services and the capacity.

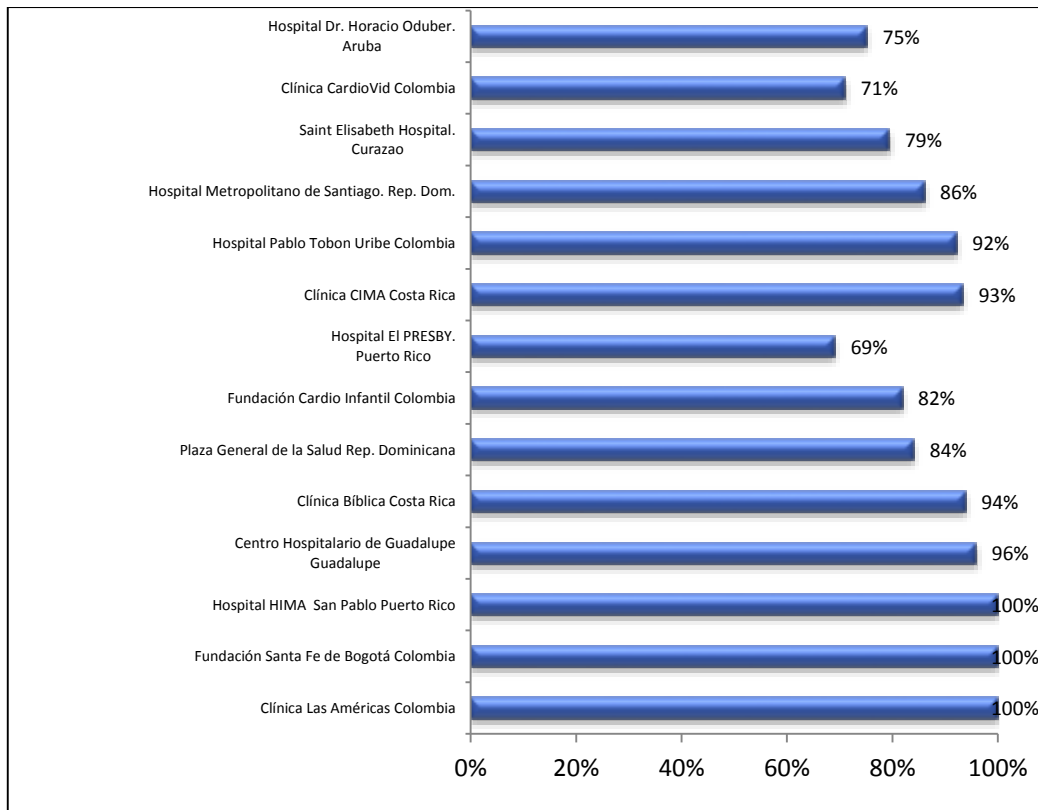

Table 15. Index of basic coverage of international services vs the installed capacity of the offer

Institutions	International Services	Basic Services Offer	Specialize Service Offer	Diagnostic services	Average
Clínica Las Américas Colombia	100%	100%	100%	100%	100%
Fundación Santa Fe de Bogotá Colombia	100%	100%	100%	100%	100%

Figure 19. Index of coverage of international services vs index of average coverage of the installed capacity

Source: Sigil Consulting Group 2014-Tabulated information

The results showed that there is a correlation between the clinics with a greater coverage of the parameters of international services and the coverage of the parameters of capacity.

2.7.2. Installed capacity

The coverage of diagnostic services index was evaluated requested in the different institutions and the reported amount of beds.

Table 16. Percentage of diagnostic services offered

Institution name	Index of coverage
Hospital Pablo Tobón Uribe Colombia	76%
Clínica Cardio Vid Colombia	65%

2.7.4. Delivered services

To evaluate this dimension, we started with the base that we requested information of the following delivered services:

- Cardiology (S1)
- Gynecology and obstetrics (S2)
- Neurosurgery (S3)
- Ophthalmology (S4)
- Oncology (S5)
- Orthopedics (S6)
- PET CT test (S7)

Considering the above and the information reported by the institutions, the amount of procedures delivered is calculated for each institution in the preceding year.

Table 19. Number of procedures by type of delivered service

Institution name	S1	S2	S3	S4	S5	S6	S7	TOTAL
Hospital HIMA San Pablo Puerto Rico	44.083	3.566	240		83.017	2.061	6.807	139.774

2.7.5. Accreditations and awards

In this dimension, the following parameters were considered for each institution in order to see the extent of the coverage for each of the listed parameters:

- Amount of international certifications (I1)
- Certifications such as Joint Commission International Accreditation (I2)
- Quality awards such as Malcom Baldrige or others (I3)
- European Quality Model – European Foundation of Quality Management EFQM (I4)
- Certifications like ISO 9001 or others. (I5)
- International awards (I6)
- Relation with universities (I7)

Table 21. Identification of parameters covered by each institution

Institution Name	I1	I2	I3	I4	I5	I6	I7
Hospital Pablo Tobón Uribe Colombia		Yes	Yes		Yes	Yes	Yes
Clínica CardioVid Colombia			Yes		Yes		Yes
Clínica Las Américas Colombia	5	Yes	Yes				Yes

3. COMPARATIVE ANALYSIS OF RATES

Although during the process of recollecting the rates some procedures were standardized, these concepts are more oriented to the Colombian rating process than the region object of the study, adding the particularities of the institutions that generated the not so homogenous information, this serves as a baseline to understand the complexity of each institution.

3.1. General approach to the comparative analysis of rates

To address the comparative analysis of the rates, groups of rates by specialty were built. Inside each group we looked for a traceable rate, that is the one with the more degree of homogeneity in the data then, a dispersion analysis is applied to this rate generating clusters that are evaluated by an expert who analyze the possible inclusions or exclusions in the value.

3.2. Analysis by groups

The identified groups, services and procedures were the following:

Group 1: Cardiology

- Placing of cardiac synchronizer
- Placing of cardiodefibrilator
- Placing of Bicameral pacemaker

We present a consolidated chart with the rates by institution in USA dollars.

Table 23. Rates by institution in US\$ for Specialty: cardiology

Surgical Procedure and/or diagnostic	Placement of Cardiac Resynchronizer	Placement of cardiodefibrilator	Placement of bicameral pacemaker
Baseline ISS 2001 rates	CARDIOLOGY

3.4. Rate models

It is important to understand that the different countries have different ways for pricing. It is very common to enter into the collection by demand with the information systems that allow reaching down to the surgical material used. It also very common that the charged fees depend on the physician and not of the institution.

4. CONCLUSIONS

With the participation of a 38% of the contacted institutions indicates that a commercial approach for contracting international health services must count with complete information and with incentives that lead the participation of the institutions. A fundamental aspect to have in mind in this process is that the institutions handed vital and key information for their commercial strategy in exchange of a possible contact with the Ministry of Health of the Netherlands.

One factor that influenced the decision to participate in the study was the size of the market and the dimension of the demand, some countries considered that a market of 18000 inhabitants was not attractive enough because of its limited size. Also, they stated the need of knowing more about the estimated demand of procedure in order to determine the potential of this market.

A second factor is related with the limited interest in developing commercial links with the government of the Netherlands and the unknown mechanisms and/or rules for contracting and payment and the mechanisms for auditing and verification of accounts that the Ministry of Health of the Netherlands have defined for the settlement of health services contracts.

As a result, the institutions limited themselves to hand the available information without additional efforts to meet the requested standards, although having an standardized instrument for data collection. The consultant team worked with the commercial management units and administration assistants in the process of gathering the data, however, all institutions manifested their decision not to hand out information that implied additional processing or standardization.

The most relevant results derived from the study were:

- In relation with the commercial process, in the 14 institutions that responded, although the access was fast and seamless, 76% of the institutions showed problems during the collection of information in terms of the availability and timely flow of information.
- In relation to the creation of a unit or department within the organizational structure for managing international patients, we found that the institutions met, on average, with 86% of the parameters of the offer of International services, 8 institutions meet 100% of the established parameters while 6 institutions meet 75% and just one with 63%.

- Institutions together, all say they have experience in dealing with international patients, 71% expressed intention to have or already have international accreditation. Overall interest shown in dealing with this type of patient.
- With regard to installed capacity, the 14 contacted hospitals have on average 288 beds and are institutions serving to a medium to high complexity cases. 88% of these institutions offer Cardiovascular Surgery, gynecology and obstetrics, neurosurgery, ophthalmology, oncology, orthopedics. The PET CT service is offered by 43% of institutions.
- Of the 14 institutions evaluated, 8 have international certifications and 5 of them international recognition. From the point of view of an international health program, these institutions offer support to the Ministry of Health on the suitability and capacity in the provision of services.
- As for the quality of service, a set of indicators was analyzed and it was found that each hospital defines its own variables and parameters of measurement for each indicator and therefore they are not completely comparable.
- 9 institutions that actually reported the surgical scheduling indicator reported compliance above 81%.
- The occupancy indicator logged and ample variability due to measurement criteria in the different institutions. The indicator of nosocomial infections is not comparable due to different measurement criteria used.
- The indicator of patient satisfaction regarding the services show values higher than 75% satisfaction, but concentrated in percentages above 90%.
- From the institutions analyzed those with larger installed infrastructure and better management for the care of international health programs are as follows: PRESBY. Puerto Rico, Colombia Children's Heart Foundation, General Health Plaza Dominican Republic, Clinica Biblica Costa Rica, Puerto Rico HIMA Health Clinic Americas Colombia and Santa Fe de Bogota Colombia Foundation.
- Comparative analysis of rates for the group of cardiology services, including implantation of cardiac resynchronizer, dual chamber pacemaker and defibrillator indicates that there are variations in rates depending on the supply of devices and this requires the establishment of mechanisms for contracting and negotiation.
- Comparative analysis of rates for services from the group of Hemodynamics catheterization, stent angioplasty and diagnostic catheterization shows that the average rate is around US \$ 5000 but with a marked variability.
- Comparative analysis of rates for services group gynecology, including caesarean section, total laparoscopic and abdominal hysterectomy and delivery care shows a lower relative variability and the average rate for the procedure is around US \$ 1,000.
- Comparative analysis of rates for the group of orthopedics services that includes 5 services: Consultation, arthroscopy unilateral knee, unilateral hip

replacement, and unilateral knee replacement, indicates from for the traced variable that full service is about US \$ 13,000, while OR Rights and fees are around US \$ 2,000.

- Comparative analysis of rates for the group of urology services, including Laser for kidney stones, extracorporeal lithotripsy and transurethral prostatectomy shows rates between \$ 1000 and \$ 7000 for procedure.
